

# Ekran System

User activity videorecording solution

**Video recording of all terminal, local, and remote sessions**  
**+**  
**Timely prevention of all possible violations**

- Control the work of your employees with business critical applications and shared resources.
- Control the work of your server administrators and the privileged users of your corporate network.
- Control the work with sensitive information and the intellectual property objects.
- Prevent all potentially forbidden and harmful actions timely
- Make your business PCI/HIPAA/SOX requirements compliant

**Kriptone**

## Audit all sessions on your servers: improve security of your enterprise infrastructure functioning

From now on you can control the work of your system administrators and other privileged users and always be sure about all their actions.

### Control

- administrators
- users
- external IT services providers

**Our solution provides you with the detailed video log about all system changes and actions performed on it.**

**Ekran System also records all keystrokes.**

As a rule, an enterprise shares the business critical applications and data: accounting programs, CRM systems, engineering software packages, documents, databases, code storages, etc. Audit of work with such objects is essential for each enterprise. Application filtering feature will allow you to focus on key activity or skip irrelevant apps.

### Audit of

- critical applications
- critical data
- critical system changes

## Audit end-points: find out what your employees do during the workday

**Ekran System helps you to get to know how your employees perform their professional duties and interact with sensitive information.**

- terminal
- local
- remote
- user
- administrator sessions

Thus, it is possible to determine how much time they spend in social networks, watching entertaining media, reading, gaming, or chatting (ICQ, Skype, MSN, etc.). Due to Ekran System reports you can get the complete list of the started applications and analyze the duration of work with them.

The possibility to connect to “live” sessions allows you to detect violations at once and act adequately.

## Get Alerts: prevent all possible violations which may occur on your enterprise timely

Ekran System helps to be more pro-active providing you with real-time Alert notifications!

Real-time triggers:

- on-monitor messages
- email notifications
- direct link to video

You set a trigger event combination and Ekran notifies you when it is activated, providing direct link to the corresponding moment in the video record. **You can see what was going and what is currently going on and decide how to react.**

If needed, you may receive such alert notifications on your e-mail as well.

## Universal coverage: monitor any kind of network configuration

- Citrix
- Terminal Server
- Remote Desktop
- VNC and any other

Ekran System works with any network protocols and any type of remote access: Citrix, Terminal, Server, Remote Desktop, VNC, VDI, VMware, NetOP, Dameware, and many others.

The solution also supports any Windows-based operating system (both server and workstation one).

## Easy-to-use analysis: tools that are always at your fingertips

Ekran System creates video record of all user actions: mouse moves, interface element selection, media materials playback, text input.

**Smart Keystroke Processing allows you to get more accurate keystroke logging to complete audit trails.**

When the user works in the browser, **Ekran System collects the URL address along with the window title.**

You can perform searches by the entered URL and enable Alert notifications on user opening forbidden sites.

- Log of all typed data
- Easy and quick searches by keywords
- URL monitoring

- Video export
- Screen capture saving
- **Scheduled reports**
- **Manually generated reports**

**To save your time while investigating**, you can perform easy search of video episodes by the keywords, such as user name, host name, application name, document name, keystrokes, or URL address.

Recorded sessions can be exported to the AVI format and each screen capture can be saved separately as well.

Ekran System provides you with report generation subsystem. Seven types of generated reports allow you to receive the information on the activity of multiple Clients, alert events, and detected URLs, and get statistics on time spent in each application or on each web-page by the user.

## Flexible licensing system

Being a full-function solution for terminal session audit with a great range of the supported configurations, Ekran System is the most cost saving offer on the market.

**Ekran System provides separated client licenses for servers and workstations, which can be easily managed within a single web-based Management Tool.**

**Ekran Server and Management Tool are provided for any customer for free.**

Due to such licensing system, you can choose the optimal package for your infrastructure without paying more for unnecessary components.
